Work package 1
In 2015, most tasks for both YOUth cohorts were piloted. For the infant & child cohort, we tested a full-day procedure with 5-month-olds (n=44) and with 10-month-olds (n=77). For the child & adolescent cohort, we have piloted the behavioral and eye-tracking tasks in a cross-sectional design (n=135; range 8-16 years).

YOUth started recruiting pregnant women in 2015. The first YOUth baby, Max, was born in November. In March 2016, Max will visit the Child Research Center for his first measurement wave. He will be then approximately 5 months old.

In February, YOUth will start recruiting children aged 8, 9 and 10 years old. Our goal is to include 3000 pregnant women and 3000 children aged 8, 9 and 10 years old in three years time.

The new cohort scanner has arrived in Utrecht

Work package 2
Cohort 3 of LCID ‘Samen Uniek’ started collecting the data in August 2015. Since then, 174 children (87 twin pairs) have visited the lab for observation, parent-child interaction tests and MRI scan.

Highlighted publications
Achterberg M, Peper JS, van Duijvenvoorde ACK, Mandl RCW & Crone EA (Accepted). Fronto-striatal white matter integrity predicts development of delay of gratification: a longitudinal study. Journal of Neuroscience

Upcoming events
CID Meeting - 22 March 2016
